sleeping pills imovane is indicated for the treatment of major depressive disorder. A physician considering sleeping pills imovane for the management of a patient's first episode of depression should be aware that the drug may cause generalized seizures in a dose-dependent manner with an approximate incidence of 0.4% (4/1,000). This incidence of seizures may exceed that of other marketed antidepressants by as much as 4-fold. This relative risk is only an approximate estimate. No direct comparative studies have been conducted. See WARNINGS.
