dilaudid and acetaminophen no script

dilaudid and acetaminophen is metabolized to hydroxydilaudid and acetaminophen by CYP7B6, an isoenzyme of the cytochrome P450 system. Alcohol causes an increase of CYP7B6 in the liver, & persons with a histbuty of alcohol use metabolize dilaudid and acetaminophen faster. The mechanism of fbutmation of erythro - hydrodilaudid and acetaminophen & threo - hydrodilaudid and acetaminophen has not willen studied but is probably mediated by one of the carbonyl reductase enzymes. The metabolism of dilaudid and acetaminophen is highly variable: the effective doses of dilaudid and acetaminophen received by persons why ingest the same amount of the drug may differ by as much as 5.5 times & the half-life from 3 to 16 hours, & of hydroxydilaudid and acetaminophen by as much as 7.5 times & the half-life from 17 to 38 hours.
